                  NetWare/IP Domain Name and Information

Status of this Memo

Copyright Notice

1.0 Abstract

   The Dynamic Host Configuration Protocol (DHCP) [RFC 2131] provides a
   framework for passing configuration information to hosts on a TCP/IP
   network. DHCP includes options for specific configuration parameters
   [RFC 2132]. This document defines options that carry NetWare/IP
   domain name and NetWare/IP sub-options to DHCP clients.

1.1 Requirements

   The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
   "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY" and "OPTIONAL" in this
   document are to be interpreted as described in RFC 2119 [RFC 2119].

1.2 Terminology

   This document uses the following terms:

      o "DHCP client"

         A DHCP client is an Internet host using DHCP to obtain
         configuration parameters such as a network address.

o "DHCP server"

A DHCP server is an Internet host that returns configuration
parameters to DHCP clients.

2. The NetWare/IP Domain Name option

This option code is used to convey the NetWare/IP domain name used by
the NetWare/IP product. The NetWare/IP Domain in the option is an NVT
ASCII [RFC 854] string whose length is inferred from the option 'len'
field.

The code for this option is 62, and its maximum length is 255.

```
      Code   Len     NetWare/IP Domain Name
     +-----+-----+------+------+------+-----
     |  62 |  n  |  c1  |  c2  |  c3  |  ...
     +-----+-----+------+------+------+-----
```

The 'len' field gives the length of the NetWare/IP Domain Name.

3. The NetWare/IP Information option

The NetWare/IP option code will be used to convey all the NetWare/IP
related information except for the NetWare/IP domain name.

The code for this option is 63, and its maximum length is 255. A
number of NetWare/IP sub-options will be conveyed using this option
code. The 'len' field for this option gives the length of the option
data, which includes the sub-option code, length and data fields.

Each sub-option contains in sequential order, a one byte sub-option
code, a one byte length, and an optional multiple byte value field.
The sub-option length gives the length of the value field for the
sub-option. The example below illustrates the use of the 'len' and
sub-option length fields in this option.

One and only one of the following four sub-options must be the first
sub-option to be present in option 63 encoding. Each of them is
simply a type length pair with length set to zero.

Sub-options:

NWIP_DOES_NOT_EXIST (code 1)

The responding DHCP server does not have any NetWare/IP
information configured.

   NWIP_EXIST_IN_OPTIONS_AREA (code 2)

      All NetWare/IP information is present in the 'options' area of the
      DHCP response packet.

   NWIP_EXIST_IN_SNAME_FILE (code 3)

      All NetWare/IP information is present in the 'sname' and, if
      necessary, 'file' fields of the DHCP response packet. If used, the
      following DHCP server behavior is required: within the 'options'
      area, option 63 is present with its length field set to 2. The
      first byte of the value field is set to NWIP_EXIST_IN_SNAME_FILE
      tag and the second byte is set to zero. Both option 62 and option
      63 will be placed in the area covered by the sname and file
      fields. Option 62 is encoded normally. Option 63 is encoded with
      its tag, length and value. The value field does not contain any of
      the first four sub-options described herein.

   NWIP_EXIST_BUT_TOO_BIG (code 4)

      Neither 'options' area nor 'sname' field can accommodate the
      NetWare/IP information.

   If either NWIP_EXIST_IN_OPTIONS_AREA or NWIP_EXIST_IN_SNAME_FILE
   sub-options is set, one or more of the following sub-options may be
   present.

   NSQ_BROADCAST (code 5)

      Length is 1 and a value of 1 or 0. If the value is 1, the client
      SHOULD perform a NetWare Nearest Server Query to find out its
      nearest NetWare/IP server.

   PREFERRED_DSS (code 6)

      Length is (n * 4) and the value is an array of n IP addresses,
      each four bytes in length. The maximum number of addresses is 5
      and therefore the maximum length value is 20. The list contains
      the addresses of n NetWare Domain SAP/RIP Server (DSS).

   NEAREST_NWIP_SERVER (code 7)

      Length is (n * 4) and the value is an array of n IP addresses,
      each four bytes in length. The maximum number of addresses is 5
      and therefore the maximum length value is 20. The list contains
      the addresses of n Nearest NetWare/IP servers.

AUTORETRIES (code 8)

   Length is 1 and the value is a one byte integer value indicating
   the number of times a NetWare/IP client should attempt to
   communicate with a given DSS server at startup.

AUTORETRY_SECS (code 9)

   Length is 1 and the value is a one byte integer value indicating
   the amount of delay in seconds in between each NetWare/IP client
   attempt to communicate with a given DSS server at startup.

NWIP_1_1 (code 10)

   Length is 1 and the value is 1 or 0. If the value is 1, the
   NetWare/IP client SHOULD support NetWare/IP Version 1.1
   compatibility. A NetWare/IP client only needs this compatibility
   if it will contact a NetWare/IP version 1.1 server.

PRIMARY_DSS (code 11)

   Length of 4, and the value is a single IP address. This field
   identifies the Primary Domain SAP/RIP Service server (DSS) for
   this NetWare/IP domain. NetWare/IP administration utility uses
   this value as Primary DSS server when configuring a secondary DSS
   server.

An example of option 63 encoding is provided below.

```
 Code   Len   NetWare/IP General Info
+-----+-----+----+----+
| 63  | 11  | 2  | 0  |
+-----+-----+----+----+
            NWIP_EXIST_IN_OPTIONS_AREA (length 0)

           +----+----+----+
           | 5  | 1  | 1  |
           +----+----+----+
            NSQ_BROADCAST_SERVER (length 1)
            value is YES

           +----+----+------------+
           | 7  | 4  | IP address |
           +----+----+------------+
            NEAREST_NWIP_SERVER (length 4)
            value is IP address of server
```

5. Security considerations

   DHCP currently provides no authentication or security mechanisms.
   Potential exposures to attack are discussed in section 7 of the DHCP
   protocol specification [RFC 2131].

   The NetWare/IP options can be used by unauthorized DHCP servers to
   misconfigure NetWare/IP clients with potentially disruptive
   information.
